Part I – General Information

In accordance with Section 56-5-1350 of the South Carolina Code of Laws, a tabulation and analysis of collision reports has been completed for the year 2010 as disclosed in this publication.

The number of traffic fatalities decreased from 894 in 2009 to 809 in 2010, a 9.5% decrease. There was also a decrease in the mileage death rate (MDR) as well. It fell to an all time low of 1.65 deaths per hundred million vehicle miles of travel from 1.84 in 2009.

Traffic fatalities are the most severe consequence of motor vehicle collisions, but even in non-fatal collisions, the cost in human suffering can be severe. There were 48,707 reported traffic injuries in 2010, up 0.8% from 2009.

Traffic collisions are responsible for billions of dollars in economic loss to South Carolina each year. Economic loss as estimated in this publication includes property damage, medical costs and lost productivity, but does not include intangible costs such as grief and suffering. In 2010, \$2.74 billion dollars in estimated loss was incurred which is a 2.6% increase from 2009.

What is responsible for the tragedy of motor vehicle collisions and what strategies should concerned individuals employ in the reduction of collisions in the future? On the following pages, statistics are presented which describe the characteristics, causes and effects of traffic collisions in South Carolina. It is hoped that this information will be useful to all persons interested in fostering a safer operating environment for motorists in South Carolina.

All collision statistics included in this publication are based on the Uniform Traffic Collision Report Forms (TR-310) received from investigating officers. By law, any collision that results in at least \$1,000 in total property damage, or results in injury or death and occurs on a public highway must be reported to the South Carolina Department of Public Safety on the appropriate form. If these collisions occur on private property or are reported on any form other than the TR-310, they are excluded.

The statistics contained in the South Carolina Traffic Collision Fact Book are based on the latest available information at the time that they were compiled. Due to the complex nature of the data, occasionally new information is received after the publication cut-off date. It is therefore possible that some discrepancies may exist between the data published here and other sources.

SOUTH CAROLINA TRAFFIC COLLISION QUICK FACTS 2010

*Mileage Death Rate per 100 million vehicle miles of travel.

**Vehicle Miles of Travel in millions of miles.

*** Due to a new reporting format, more 'possible injuries' were reported than in previous years.

****Reporting threshold changed midyear to \$1,000 from \$400.

MILEAGE DEATH RATE SOUTH CAROLINA vs. NATIONAL AVERAGE 25 YEAR TREND 1985-2010

Source for U.S. data: National Highway Traffic Safety Administration. (NHTSA)

South Carolina's mileage death rate (MDR), which is defined as "the number of traffic fatalities per 100 million vehicle miles of travel," achieved an all time low of 1.7 in 2010. The national MDR also achieved an all time low of 1.1 in 2010.

PRIMARY CONTRIBUTING FACTOR

The 2010 South Carolina Traffic Collision Fact Book reports on the primary contributing factor (see page 131) in a traffic collision. This information comes directly from the collision report form filled out by the investigating officer. It is important to realize that while the report form has a field for primary contributing factor; it can also report up to four (4) other contributing factors for each collision. Thus, we rely on the investigating officer's judgment as to the primary contributing factor for a collision.

Some action (or inaction) by one or more of the drivers was cited as the primary contributing factor in 99,477 of the 107,673 reported traffic collisions in 2010. This accounted for 92.4% of all primary contributing factors, a percentage slightly less than the previous year of 92.9%. In fact, the top eight primary contributing factors were driver related. Environmental factors accounted for the next largest category of collision causes with 4,251 or 3.9% of the total. The vast majority of these (3,542) involved an "Animal in the Roadway," and accounted for 3.3% of all collisions. The "Non-Motorist", "Road" and "Vehicle" categories together accounted for only 3.7% of all reported traffic collisions in 2010.

For fatal collisions in 2010, some type of driver error was considered the primary contributing factor in 652 of the 750 collisions, accounting for 86.9% of all collisions in which someone was killed. This percentage is lower than that of all collisions, which is 92.4%. The specific causes of fatal collisions were quite different from all collisions. The leading primary contributing factor of fatal collisions was "Driving Under the Influence" with 182 collisions (24.3%). A distance second was "Driving Too Fast for Conditions" with 154 collisions (20.5%). The next leading factors were "Failed to Yield Right of Way", "Wrong Side or Wrong Way", and "Ran Off Road" with 73, 50, and 37 fatal collisions, respectively. The proportion of "Non-Motorist" causes was much higher in fatal (10.5%) as compared to property damage only collisions (0.4%).

FIRST HARMFUL EVENT

The first harmful event (FHE) in a traffic collision is defined by the National Safety Council as the first occurrence of injury or damage in a collision. In 2010, the FHE in 83,882 of the 107,673 reported traffic collisions (77.9%) involved some type of collision between a motor vehicle in transport and an object not fixed. The top two FHE's, both involving a collision with an object not fixed, were "Collision with Motor Vehicle in Transport," 71,308 (85.0% of the collisions with an object not fixed) and "Collision with Stopped Vehicle," 7,709 (9.2% of the collisions with an object not fixed). The third top FHE was "Ditch" in the "Collision with Fixed Object" group, with 4,562 collisions (4.2% of all collisions). Combined, these three accounted for more than 77% of all reported collisions.

"Collisions with an Object Not Fixed" accounted for a substantially smaller percentage of the fatal collisions (50.1%) than the property damage only collisions (80.4%). Collisions involving a "Collision with a Fixed Object" accounted for a substantially greater percentage of the fatal collisions (37.9%) than for property damage only (16.6%). The leading FHE in fatal collisions was "Collision with Motor Vehicle in Transport" with 264 (35.2%); the second leading FHE in fatal collisions was "Collision with Tree" with 112 (14.9%).

Part II – Collision Characteristics

There are many characteristics associated with traffic collisions. Patterns in these characteristics can provide insight into the cause of collisions and may ultimately lead to effective countermeasures for reducing the number of collisions that occur and minimizing the severity of those that will still occur. The data provided on the following pages may raise interesting questions for those interested in highway safety. These questions may in turn lead to research, which addresses a particular collision characteristic. Here are some examples of traffic collision characteristics for 2010:

A. Driver

- ◆ Male drivers between the ages of 20 and 24 continue to be over represented in fatal collisions. In 2010, male drivers in this age group represented 4.0% of all licensed drivers and 8.6% of drivers involved in fatal collisions.
- ◆ Male drivers made up 70.1% and female drivers made up 27.1% of the drivers involved in fatal collisions (2.9% of drivers' gender was unknown).
- ◆ The leading traffic violation written during a collision investigation in 2010 was "Speeding less than 10 miles over the limit".

B. Time

- ◆ More than 64% of fatal collisions occurred between the hours of 3:01 p.m. and 3:00 a.m.
- ◆ The months of October, March and May the most fatal collisions with 74, 71 and 70 respectively.
- ◆ More traffic deaths occurred on the three weekend days (Friday, Saturday, Sunday) than on the four week days (Monday, Tuesday, Wednesday, and Thursday).
- ◆ The leading Holiday Period for fatalities in 2010 was the Christmas Holiday with 12 fatal collisions and 13 fatalities.

C. Location

- ◆ More fatal collisions (256 or 34.1%) and deaths (278 or 34.4%) occurred on state secondary routes than on any other route category.
- ◆ There were 76 fatal collisions on South Carolina Interstates resulting in 86 persons killed.

D. Environment

- ◆ More than 87% of all traffic collisions occurred during clear or cloudy weather conditions.
- ◆ Nearly 84% of all collisions occurred on a dry road surface.
- ◆ There were 10 persons killed in work zone collisions in 2010.

E. Vehicles

- ◆ Automobiles made up about 54% of all units involved in traffic collisions during 2010.
- ◆ There 1,074 units defined as motor vehicles involved in fatal traffic collisions. Automobiles, pickup trucks, and SUV's made up 80% of the motor vehicles involved in fatal crashes.

A. THE DRIVER

Numerous decisions are required of drivers while operating a motor vehicle. All too often, poor judgment, inattention or carelessness on the part of a driver results in a dangerous driving decision, which leads to a traffic collision. The primary contributing factor in 92.4% of all reported traffic crashes was driver-related in 2010. Often, the officer investigating the collision will issue a citation to one or more of the drivers involved. Driver violations charged to drivers involved in traffic collisions reported during 2010 are as follows:

<u>Violation</u>	<u>Amount</u>	<u>%</u>
1. Speeding < 10 MPH Over Speed Limit	21,936	30.80%
2. Failure to Yield Right of Way	11,978	16.82%
3. Driving Under the Influence	5,215	7.32%
4. Driver's License Violation	3,553	5.00%
5. Following Too Closely	3,744	5.26%
6. Other Moving Violation	3,746	5.26%
7. Changing Lanes Unlawfully	2,922	4.10%
8. Traffic Signal/Sign/Light Violation	2,706	3.80%
9. Driving Under Suspension	1,807	2.54%
10. Illegal Turning	1,358	1.91%
11. Other Violations	12,234	17.18%
Total	71,199	100%

Enumerated on the following pages are the numbers of licensed drivers by age and gender and the number of drivers involved in collisions by age and gender. Based on the figures indicated in these tables, nearly 1 out of every 10 (10.4%) of all licensed male drivers between the ages of 15 and 24 years of age was involved in a traffic collision in 2010. About 1 in 11 (9.3) of the female drivers in the same age group were involved in collisions. For the entire licensed population, approximately one out of every 17 drivers was involved in a collision during the year. Nearly 70% of the drivers in fatal crashes were male.

**Property Damage Only

NOTE: These figures only represent drivers of units defined as a motor vehicle.

OUT OF STATE DRIVERS INVOLVED IN TRAFFIC COLLISIONS*

SOUTH CAROLINA DRIVERS TOTALED 161,570

***Figures represent only drivers of any motor vehicle requiring a valid driver's license. There were 16,710 drivers that did not present a valid driver's license at the time of the crash or driver's license information was not available.**

DRIVERS INVOLVED IN FATAL COLLISIONS BY ROUTE CATEGORY AND LICENSE STATE

INTERSTATE - 123 DRIVERS

US PRIMARY - 292 DRIVERS

SC PRIMARY - 298 DRIVERS

SECONDARY - 342 DRIVERS

Note: There were 31 drivers involved in fatal collisions on county routes in 2010.

B. TIME

The frequency of traffic collisions is affected by the settings of the clock and calendar. The concentration of traffic, for example, is heavier at certain times of the day, days of the week and month. Travel is also affected by holidays and by special events such as football games. In addition to travel, driver attitudes, vision and behavior are influenced by time factors, weather, and time of year. On the following pages, statistics are presented which indicate observable time variables. Some of the important observations in the 2010 data are as follows:

- ◆ More traffic deaths occurred on the three weekend days (Friday, Saturday, Sunday - 425), than on the four weekdays (Monday, Tuesday, Wednesday, Thursday - 384).
- ◆ The most frequent time of day for all collision types was 3:01pm -6:00pm. Fatal collisions occurred more frequently during this time period, accounting for 18% of the total.
- ◆ More traffic collisions were reported on Friday than any other day of the week with 19,289 collisions during 2010, accounting for more than 17% of the total. No other day of the week experienced as many as 17,000 collisions. The fewest traffic collisions were reported on Sundays with 10,940 or 10%.
- ◆ As in past years, more fatal collisions were reported on Saturday (147) than any other day. This accounted for about 20% of all fatal collisions and resulted in the deaths of 160 persons. The fewest number of fatal collisions occurred on Monday with 82, resulting in 85 fatalities.
- ◆ October was the leading month for all collisions in 2010, with 9,804. The leading month for fatal collisions was also October with 74 collisions resulting in 82 fatalities. February and June had the fewest fatal collisions with 48 and 47 collisions resulting in 49 and 53 fatalities respectively.

C. LOCATION

No area of South Carolina was immune from traffic collisions in 2010. Every county experienced the tragedy of at least one fatal traffic collision during the year. Five of the state's 46 counties had at least 40 traffic fatalities during 2010 (see page 81 for collisions by county). A variety of factors influence where traffic collisions, injuries and fatalities occur including the volume of traffic on a particular highway, weather variations and travel patterns. Statistics are presented on the following pages, which indicate observable differences in the occurrence of traffic collisions with relation to various location categories. Some important observations in the data are as follows.

- ◆ In 2010, Greenville County had the most total traffic collisions (12,137) and the most property damage only collisions (9,203); Charleston County had the most injury collisions (3,116) and non-fatal injuries (4,557). Charleston and Greenville Counties had the most fatal collisions (49 each) and also had the most fatalities (51 and 50 respectively).
- ◆ A total of 59,129 collisions were investigated by the South Carolina Highway Patrol. This represents 54.9% of all traffic collisions in South Carolina for 2010. The Highway Patrol investigated an even greater proportion of the fatal crashes 81.1%.
- ◆ In 2010, Secondary and US Primary routes had the most traffic collisions. Respectively, they had 32.6% and 27.1% of the reported total. SC Primary routes were next, accounting for 22.1% of the total collisions.
- ◆ The Secondary routes accounted for the largest percentage (34.1%) of fatal collisions. The 256 fatal collisions that occurred on Secondary routes represent almost three and a half times the number of fatal collisions (76) reported on South Carolina's Interstates.
- ◆ A total of 10,736 collisions occurred on the interstates. This was about 10% of the total reported traffic collisions for the year.

COLLISIONS INVESTIGATED BY AGENCY TYPE

AGENCY TYPE	COLLISION TYPE				PERSONS	
	Fatal	Injury	PDO*	Total	Killed	Injured

2010 South Carolina Traffic Fatalities per 100,000,000 VMT*

ROUTE CATEGORY IN NON-FATAL VS. FATAL COLLISIONS

There were 35,112 traffic collisions reported on Secondary routes during 2010. This was the most for all the route category classifications and accounted for 32.6% of all reported collisions. US Primary routes were second, accounting for 29,173 of the reported collision total. The fewest reported collisions were on County routes; a total of 8,898 were reported for these routes.

Secondary routes had the most fatal collisions by a wide margin. The 256 fatal collisions occurring on the Secondary route system accounted for 34.1% of the 750 fatal collisions reported in 2010. On the US Primary and SC Primary routes there were 189 and 200 (respectively) fatal collisions reported for the year. The fewest number of fatal collisions occurred on the County routes with 29 (3.9%). A total of 76 (10.1%) fatal collisions were reported for the Interstate routes.

D. ENVIRONMENT

The environment in which motorists operate their vehicles can contribute to the occurrence of traffic crashes. Environment is defined herein as the combination of external or extrinsic physical conditions that affect and influence the operation of a motor vehicle. These include road surface, weather, light conditions, traffic control, road character, trafficway, junction type, and work zone type for each driver.

One or more of the environmental factors can be the primary factor of a collision or may be a contributing factor in a given crash. Weather, light, and surface conditions are substantially beyond the control of engineering or law enforcement efforts. Changes in traffic controls, road character, trafficway, junction type, and work zone type factors can all be effected by traffic engineering efforts.

As reflected in the statistics on the next two pages, most collisions occur under favorable environmental conditions: dry roadway (83.8%); clear weather (80.8%); daylight (69.3%); no traffic control device (59.6%); and straight-level road (78.9%).

For fatal collisions, the percentages of collisions which occurred under the most favorable surface and weather conditions were about the same or even higher for most environmental factors. The largest difference is seen in light conditions, where 55.2% of fatal collisions did not occur during daylight hours compared to 44.8% that occurred during daylight hours. The percentages of fatal collisions occurring under the most favorable environmental conditions are as follows: dry roadway (91.7%); clear weather (87.6%); daylight (44.8%); no traffic control (72.7%); and straight-level roadway (61.6%).

Environmental factors were the primary contributing factor in only 3.9% of all collisions in 2010. The environment may have been a contributing factor to collisions where it was not the primary contributing factor. Efforts to improve those environmental factors which can be controlled (especially traffic control and road character) should help to reduce the frequency of traffic crashes in South Carolina.

E. UNITS

The consequences of traffic collisions are affected by the types of 'units' that are involved. A collision between a relatively large unit, such as a truck or train, and a smaller unit, such as a motorcycle, transmits a substantially greater force to the smaller vehicle, and hence to its occupants or riders, than a collision between two vehicles of comparable size. This irrefutable law of physics probably accounts for the over representation of certain 'unit types' in traffic collisions. Some of the key findings in the 2010 data are as follows:

- ◆ The most common unit involved in traffic crashes in 2010 was the automobile. Out of 198,901 units involved in traffic collisions during the year, 105,958 were automobiles. This represents 53.3% of the total units.
- ◆ For fatal collisions, a much smaller percentage of units involved were automobiles. Of the 1,227 units involved in fatal collisions, 453 or 36.9% were automobiles.
- ◆ There were 90 pedestrians killed in 2010. This represents 9.2% of all pedestrians involved in traffic crashes during the year.
- ◆ There were 3 fatal crashes involving railway trains resulting in 3 fatalities.
- ◆ There were 81 fatal crashes involving motorcycles resulting in 84 fatalities.
- ◆ A total of 46 fatal crashes involving truck tractors resulted in 52 deaths in 2010.

A motor vehicle traffic collision is defined by the National Safety Council (NSC) as one in which: (1) the unstable situation originates on a trafficway or (2) a harmful event occurs on a trafficway. Using the NSC definition, each of the unit types listed above was involved in a collision which involved at least one motor vehicle. Units considered as motor vehicles are denoted with (**). Units denoted by three asterisks, (***) may or may not be a motor vehicle, depending on the means by which they were propelled. For units not considered motor vehicles, the collision included at least one other unit which was a motor vehicle.

By far the most frequent action prior to impact for units involved in traffic collisions in 2010 was 'Movement Essentially Straight Ahead', with 55% of the total units. For fatal collisions 'Movement Essentially Straight Ahead' made up 73% of all units in fatal collisions. The second most occurring action prior to impact for all collision types was 'Slowing or Stopped in Traffic' accounting for 21% of the units. For fatal crashes the second most seen action prior to impact for vehicles was 'Turning Left' accounting for 4% of the units.

¹Based on 10,000 cycle registrations²Based on 100 cycle registrations

* Includes all fatalities (not just motorcyclists) in motorcycle collisions.

**1973-Lights On Law effective July 1.

***1975-Implemented Classified License Law for motorcycles.

****1980-Helmet and Goggles Law amended effective June 16, exempting cyclists 21 and older.

@ Registrations include 2-wheel and 3-wheel motorcycles.

Part III – Collision Consequences

The consequences of traffic collisions extend beyond those persons directly affected and are measured in both human and economic terms. The economic costs consider that portion of financial loss borne by society (i.e. medical costs), property damage, lost productivity, etc. Opposite the economic losses are the intangible human costs associated with the grief and suffering that accompanies a traffic death or injury. On the following pages, statistics related to estimated economic cost, traffic injuries, fatalities and restraint usage are presented. Some important observations in the 2010 data are as follows:

- ◆ Economic loss increased by 2.6% in 2010.
- ◆ Males accounted for 70.8% of the traffic fatalities in 2010, up from 70.5% in 2009. In 1972, males accounted for 75.3% of all traffic fatalities.
- ◆ There were 236 females who died in traffic collisions in 2010 and 573 males.
- ◆ A total of 211 persons under the age of 25 were killed in traffic collisions, accounting for 26.1% of the total persons killed.
- ◆ There were 660 automobile, truck and van occupants totally ejected from the vehicles in which they were riding. Of these, 155 (23.5%) were killed. Of the 253,369 occupants not ejected, 399 (0.2%) were killed. The percentage of fatalities suffered by ejected occupants was more than 100 times that of occupants not ejected.
- ◆ In 2010, there were 9,813 children under the age of six who were occupants of a car or truck that was involved in a traffic collision. Of these, 7,460 were restrained by a child safety seat, 1,988 by some other restraint (seat belt, seat/lap combination), 189 were unrestrained and for 176 restraint usage was unknown.
- ◆ Of the 547 occupant fatalities with known restraint usage, 314 (57.4%) were not restrained, and 233 (42.6%) were restrained.
- ◆ Nearly 19% of those occupants not wearing a seat belt at the time of collision were severely injured or killed. This compares to less than 1.0% for those wearing a seat belt.

TRAFFIC FATALITIES BY SEATING LOCATION MOTOR VEHICLE OCCUPANTS ONLY

FATALITY RESTRAINT USAGE BY SEATING LOCATION

Part IV – Driving Under the Influence

Alcohol and/or drug related traffic collisions are responsible for a large portion of reported traffic collisions each year. The percentage of collisions that involve alcohol or drugs increases as the severity of injuries increases. On the following pages collision statistics are presented which are based on contributing factors in the collision, as determined by the investigating officers.

The data presented in this section come from two different sources for Fatal and Non-fatal collisions:

1) Fatal Collision Data:

The National Highway Traffic Safety Administration (NHTSA) uses a method called 'multiple imputation' when fatal collisions are lacking blood alcohol concentration (BAC) values on drivers involved in fatal collisions. This method uses various aspects a fatal collision in order to provide estimates of alcohol involvement and BAC levels. NHTSA's data does not include driving under the influence of drugs.

2) Non-fatal Collision Data:

The data presented for non-fatal collisions comes from the information collected from the Uniform Traffic Collision Report Form (TR-310 – shown on pages 129 and 130) filled out by the investigating officer. The South Carolina DUI data includes being under the influence of alcohol and/or drugs.

In South Carolina, it is inferred that you are under the influence when your Blood Alcohol Concentration (BAC) reaches a level of 0.08 (as of July 2003). At this level, you are seven times more likely to have a traffic collision than if your BAC is zero. If your BAC reaches 0.15 percent, your chances of having a traffic collision are 25 times greater. Some of the common effects of alcohol at various BAC levels are as follows:

Blood Alcohol Concentration	Changes in Feelings and Personality	Physical and Mental Impairments
0.01 – 0.06	Relaxation Sense of Well-being Loss of Inhibition Lowered Alertness Joyous	Thought Judgment Coordination Concentration
0.06 – 0.10	Blunted Feelings Disinhibition Extroversion Impaired Sexual Pleasure	Reflexes Impaired Reasoning Depth Perception Distance Acuity Peripheral Vision Glare Recovery
0.11 – 0.20	Over-Expression Emotional Swings Angry or Sad Boisterous	Reaction Time Gross Motor Control Staggering Slurred Speech
0.21 – 0.29	Stupor Lose Understanding Impaired Sensations	Severe Motor Impairment Loss of Consciousness Memory Blackout
0.30 – 0.39	Severe Depression Unconsciousness Death Possible	Bladder Function Breathing Heart Rate
=> 0.40	Unconsciousness Death	Breathing Heart Rate

DEFINITIONS – FOR THE PURPOSE OF THIS PUBLICATION

DUI – Driving under the influence of alcohol and/or drugs.

DUI .08+ - Driving with a BAC of .08 or more.

ALCOHOL IMPAIRED DRIVING FATALITY– A fatality that occurs in a motor vehicle traffic crash that involves at least one driver or a motorcycle rider (operator) with a BAC of .08 or above.

Part V – Counties

South Carolina is comprised of 46 counties, each with its own unique set of demographic, geographic, and political characteristics. These and other factors influence events within a county's borders. Using this information, planners can tailor specific countermeasures to the unique situation of a given county. Crime, economic activity, accidents and the subject of this book (traffic collisions) are all affected by these characteristics. On the following pages, a summary of each county's traffic collision characteristics is provided. Among other facts, this data shows the following for 2010:

- ◆ Greenville County had the most traffic collisions with 12,137. This total was nearly 1,000 more than the number two county Charleston with 11,756 and 1,200 more than the third highest county, Richland with 10,443 collisions.
- ◆ Greenville County and Charleston County had the most fatal collisions with 49 reported during the year, followed by Horry with 46 and Spartanburg and Richland with 41. The same three counties had the most fatalities as well, Charleston with 51, Greenville with 50, and Horry with 48.
- ◆ Charleston County had the most injury collisions and persons injured, with 3,116 and 4,557, respectively, in 2010. Greenville County was next with 2,885 injury crashes and 4,280 injuries. Richland County was third for injury collisions and injuries with 2,707 injury collisions and 4,202 injuries.
- ◆ The high number of collisions in Greenville, Charleston, and Richland Counties is largely a result of large populations and larger amounts of travel within these counties.
- ◆ The counties with the highest number of fatalities per 100 million vehicle miles of travel (VMT) were Chesterfield, Marion, and Williamsburg with 2.73, 2.49, and 2.37 VMT fatality rates. For South Carolina, the overall VMT fatality rate was 1.53 which is an all time low for our State.

[illegible]

DEFINITIONS

Blood Alcohol Concentration (BAC) - The percentage of a blood sample that is alcohol; e.g., a BAC of .10 is a sample of blood with 1 part alcohol for every 999 parts blood.

Bus - A motor vehicle designed to transport sixteen (16) or more persons, including the driver.

Collision - Throughout this publication the terms collision and traffic collision are equivalent to the term motor vehicle traffic collision as defined below.

Driver - An occupant who is in actual physical control of a transport vehicle, or for an out-of-control vehicle, an occupant who was in control until control was lost.

Driver Intention - What the driver intended to do just prior to the first harmful event and before executing an evasive maneuver.

Economic Loss - All figures are rounded to the nearest \$100,000. Based on the 2009 National Safety Council Formula which applies with the following factors:

Each fatality	\$1,290,000
Each incapacitating injury.....	\$67,800
Each non-incapacitating injury.....	\$21,900
Each possible injury.....	\$12,300
Each *PDO collision.....	\$8,300

*Property Damage Only

Fatal Traffic Collision - Any traffic collision that results in the death of at least one occupant or pedestrian as a direct result of injuries sustained in the collision within 30 days of the collision date.

First Harmful Event - The first event in a traffic collision to result in injury or property damage.

Harmful Event Location - The place, on or off the roadway, where the first injury or property damage occurred. This describes the location of the first harmful event as it relates to its

position within or outside the trafficway.

Incapacitating Injury - Any injury, other than a fatal injury, which prevents the injured person from walking, driving or normally continuing the activities he was capable of performing before the injury occurred.

Junction - Either an intersection or the connection between a driveway access and a roadway other than a driveway access.

Manner of Collision - The identification in a crash of how the motor vehicle(s) initially came together in a traffic collision.

Motor Vehicle - Any motorized (mechanically or electrically powered) road vehicle not operated on rails, excluding mopeds, minibikes and other vehicles not subject to motor vehicle licensing regulations. These include: automobiles, trucks, buses, vans and motorcycles.

Most Harmful Event - The event for an *individual unit* involved in a traffic collision that results in the most severe injury or property damage.

Motor Vehicle Traffic Collision - A transport collision that involves at least one (1) motor vehicle in transport, in which the unstabilized situation originates on a trafficway or at least one harmful event occurs on a trafficway. This definition excludes any collision on a private way.

Non-Incapacitating Injury - Any injury, other than a fatal injury or incapacitating injury, which is evident to observers at the scene of the collision in which the injury occurred.

Nonjunction - Anything that is not an intersection or the connection between a driveway access and a roadway other than a driveway access.

DEFINITIONS

Occupant - Any person who is part of a transport vehicle (automobile, bicycle, etc.)

Passenger - Any occupant of a vehicle other than its driver.

PDO - An abbreviation for property damage only. A PDO collision is one with some property damage but no injuries or fatalities.

Pedalcycle - A non-motorized vehicle propelled by pedaling (bicycle, tricycle, etc.). Note: The pedalcycle pages include all types but mostly bicycles.

Pedestrian - Any person who is not an occupant as defined above. Includes persons on foot, roller skates, and skateboards.

Possible Injury - Any injury that is reported or claimed which is not a fatal injury, incapacitating injury or non-incapacitating injury.

Primary Contributing Factor - Refers to the primary reason for the traffic collision. This is the presumptive factor that created the collision situation.

Private Way (Private Property) - Any land other than a trafficway. This includes parking lots even if they are designed for public use. Collisions on private ways are not included in this publication.

Road - The part of a trafficway which includes both the roadway and any shoulder alongside the roadway.

Rural Area - Any area which is not within a defined urban area.

Traffic Collision - Used in this publication interchangeably with Motor Vehicle Traffic Collision.

Traffic Unit (Unit) - Any motorized road vehicle (includes vehicles that do and do not qualify as motor vehicles in the above definition), pedestrians, animal drawn vehicle and animals with human riders.

Trafficway - Any land way open to the public as a matter of right or custom for moving persons or property from one place to another.

Truck Tractor - A motorized vehicle consisting of a single motorized transport device designed primarily for drawing.

Unit - Used interchangeably with traffic unit (see definition above).

Urban Area - An area composed of an incorporated place of at least 5,000 population along with the surrounding densely settled areas.

ACKNOWLEDGEMENTS

The Office of Highway Safety and Justice Programs of the South Carolina Department of Public Safety would like to take the opportunity to express our sincere appreciation to all persons, agencies, departments and organizations who have contributed to this publication.

The vast majority of data used to produce this publication was tabulated from the Uniform Traffic Collision Report for Investigating Officers. These reports were submitted by members of the South Carolina Highway Patrol, City Police Departments and various other Law Enforcement Agencies.

The Office of Highway Safety and Justice Programs gives special recognition to the above traffic investigative agencies and, in doing so, cannot forget the support and cooperation of other agencies and organizations.

The Office of Highway Safety and Justice Programs, which tabulated the traffic collision data and other pertinent information for this publication, could not have done so without the untiring efforts of the above persons and organizations.
